RESILIENCE

RESILIENCE AND DISASTER RISK REDUCTION ???

Critical steps: 1994 . . . 2005 . . . 2009

ENGINEERING

1858 *Rankine*
“Strength and
ductility”

ECOLOGY

1973 *Holling*
“adaptability
and absorption”

PSYCHOLOGY

1984 *Garmezy*
“Competence
and resources”

In this field, Resilience has been defined as “the ability of a system, community or society exposed to hazards to resist, absorb, accommodate to and recover from the effects of a hazard in a timely and efficient manner, including through the preservation and restoration of its essential basic structures and functions.” (ISDR, 2009).

The force of a human society under stress is the capacity to plan facilities to endure disasters and preserving integrity (consistency) and ability to adapt a disasters for reduce impact (ductility)
[ALEXANDER 2012]

A NEW FORMULA...

Risk Reduction

...FOR A NEW PERSPECTIVE!

WHY MEASURE RESILIENCE COMMUNITY?

HOW CAN EVOLVE AN EVENT...OR NOT...

A big event, when the normal resources available are insufficient to face and resolve the event. We lose the control of event.

An event (natural, anthropic, predictable unpredictable) where factors Time and available Resources have a central role to face the situation, avoid further crises and resolve hazard situations or bad evolution of the event.

A balance system (static, dynamic, natural or anthropic) stressed by one or more factors (inside or outside of system)

The resilience's measurement of a territorial system, through the indexing of its key factors, will allow identification of its "emergency threshold".

COMMUNITY DISASTER RESILIENCE FRAMEWORK

the emergency threshold of a region is given by the rapport between the parameters of the extreme event and those of the social-economic context.

The emergency threshold value indicates the limit beyond which the territorial system loses stability.

A territorial system can be made less vulnerable through a more effective equilibrium between actions of resilience and resistance.

The resistance actions reduce the primary vulnerability (structural), the resilient actions minimize the secondary (functional) and deferred vulnerability (socio-economics).

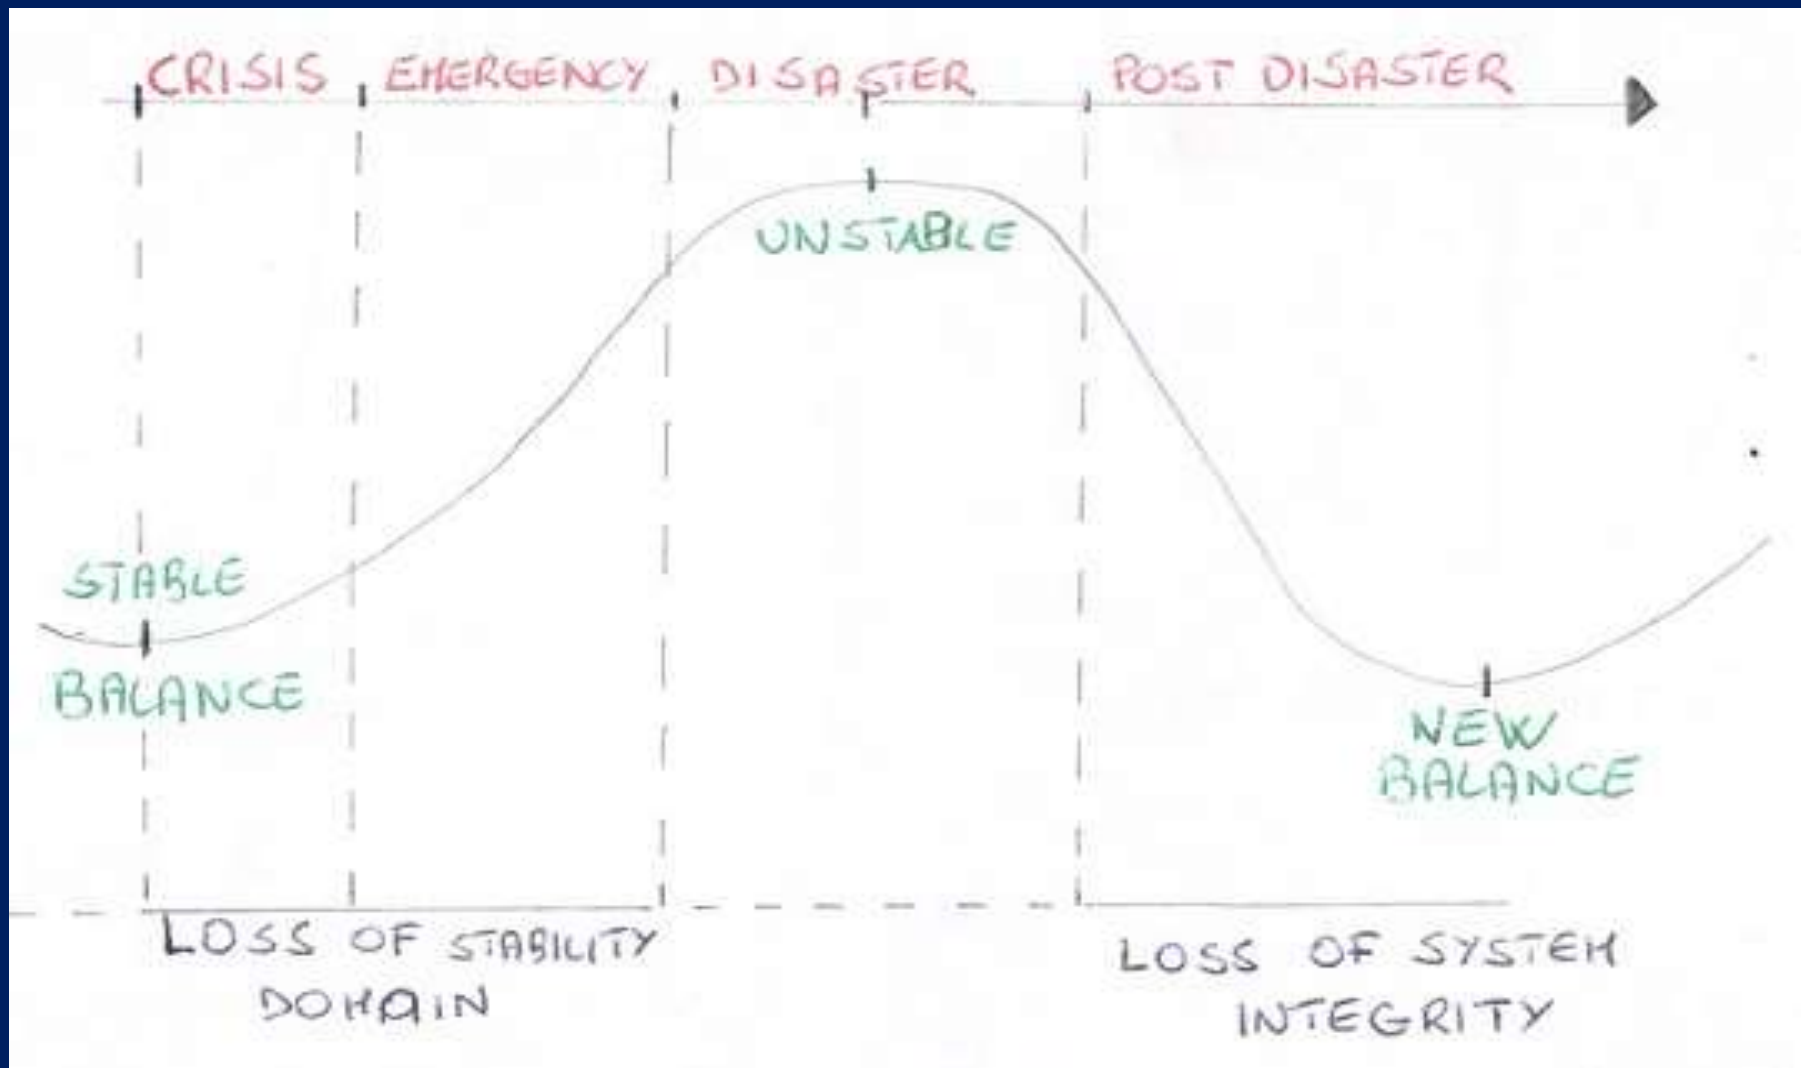

Emergency Threshold Index (ETi)

The definition of an emergency threshold index (ETi) helps to define the limit of a territorial system to sustain the impact of an extreme event, and suggest strategies to enhance/elevate such limits (reinforce the territorial system).

**Emergency
Threshold
Index (ETi)**

BETWEEN CRISIS AND CATASTROPHES

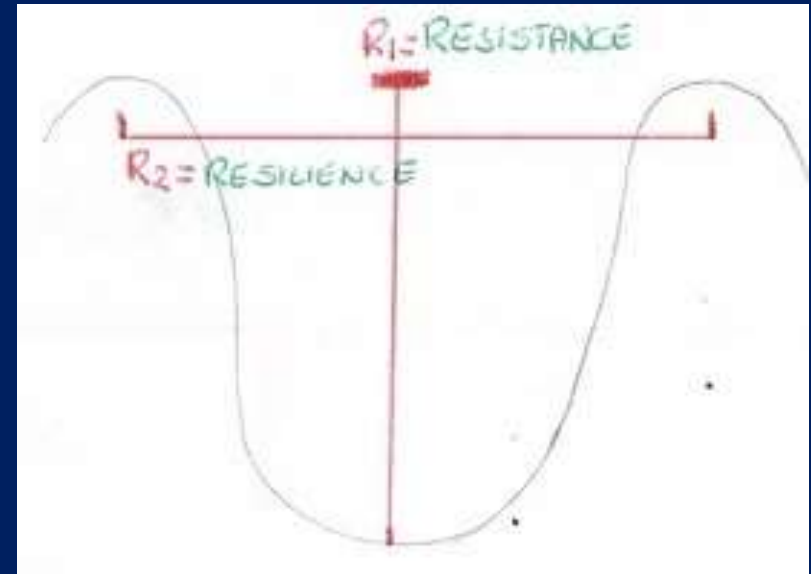

ENERGY, VULNERABILITY AND CAPABILITY, IS THERE A COMMON POINT ?

ENERGY

CAPABILITY

$$\text{Energy} = K_e + E_p = \text{Constant (C}_e)$$

where:

K_e = Kinetic energy and,
 E_p = Esponential energy.

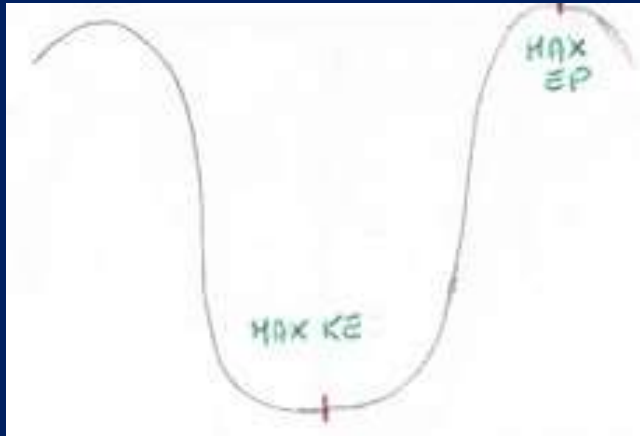

$$\Delta C = \Delta R_1 + \Delta R_2 = \text{Constant (C}_c)$$

where:

R_1 = resistance

R_2 = resilience

IS IT A PROBLEM OF ENERGY... OR RESOURCES ?

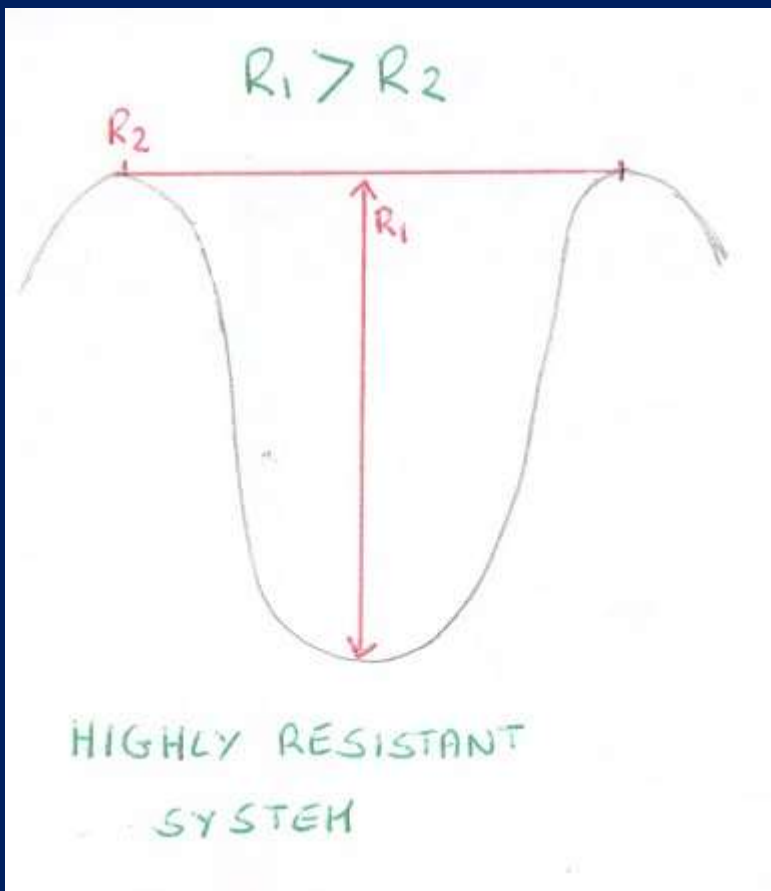

↓

$$Cv = \text{Emergency Threshold index} = Cc$$

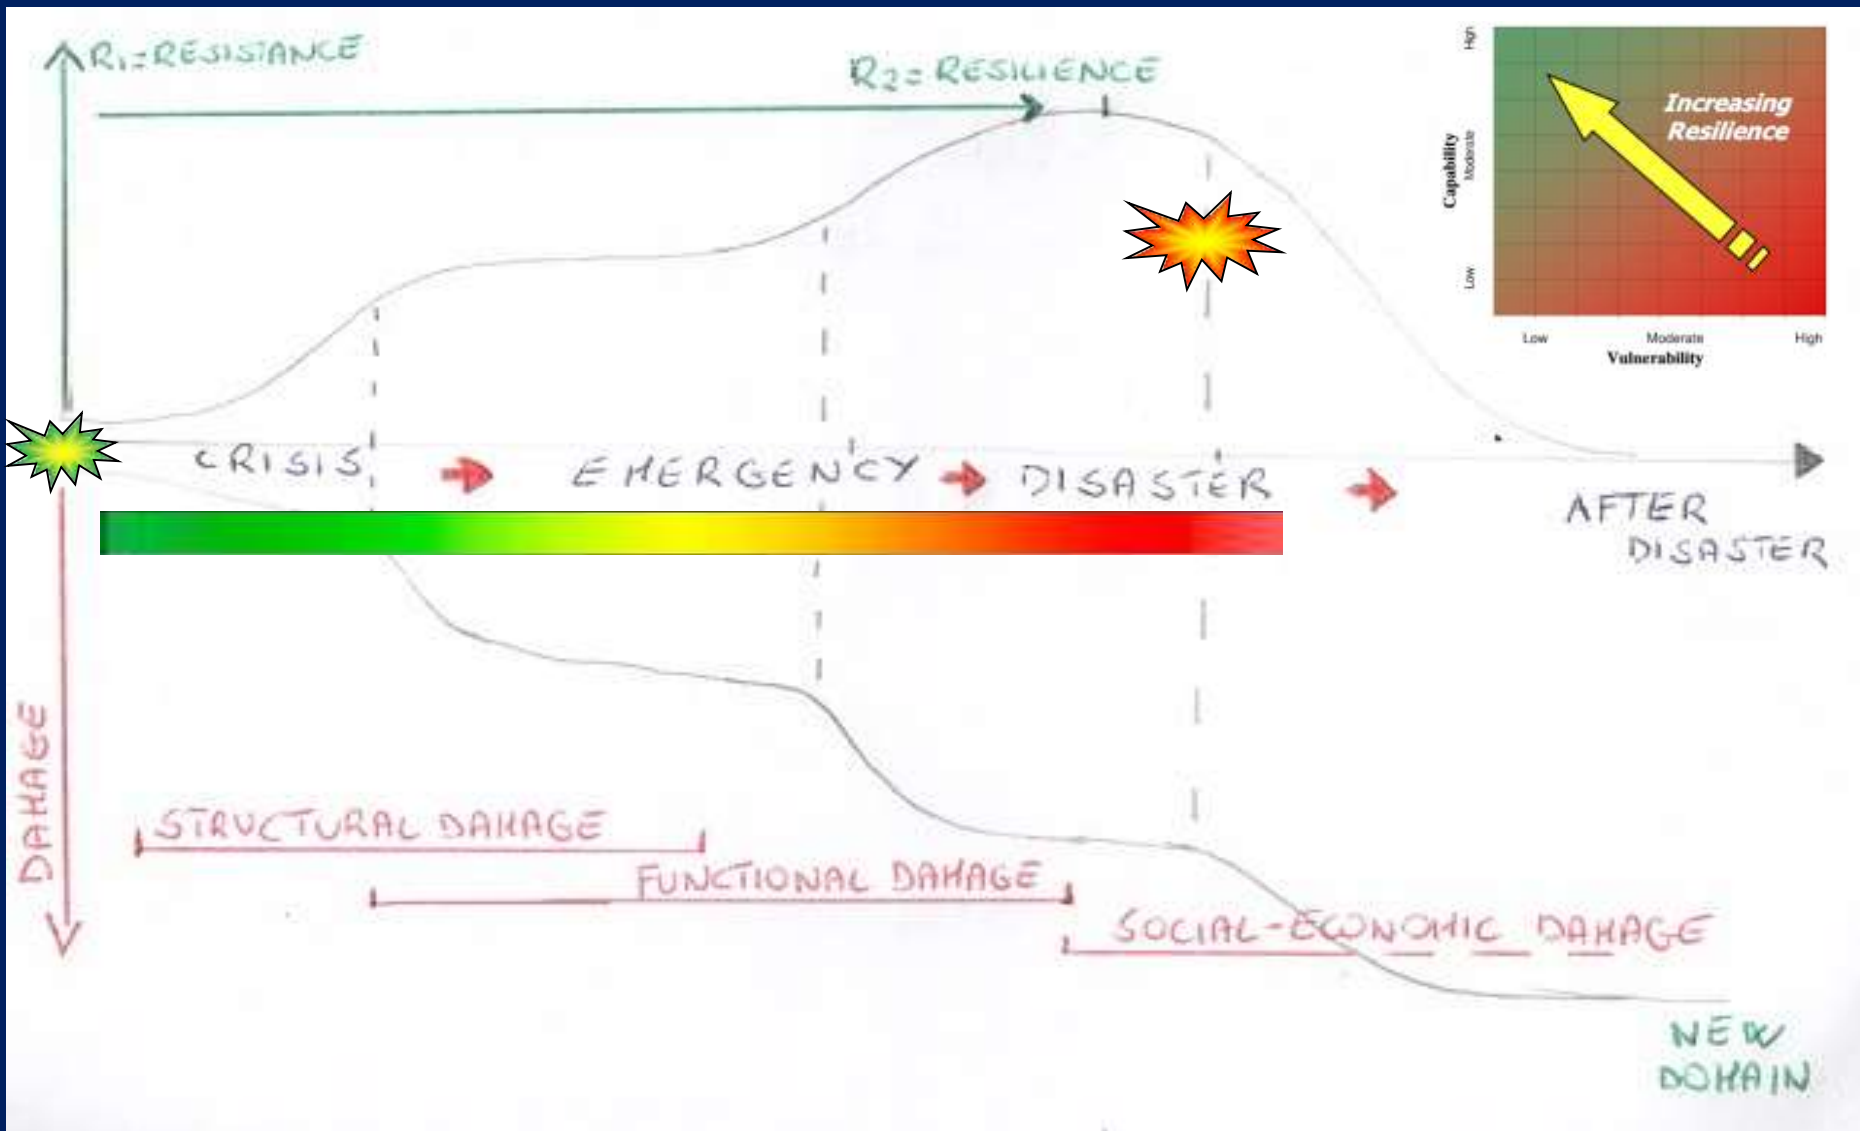

↓

IF $Cc > Ce$ = the system is protect
IF $Cc < Ce$ = the system is vulnerable

IS IT BETTER A RESISTANCE SYSTEM, RESILIENT...OR...?

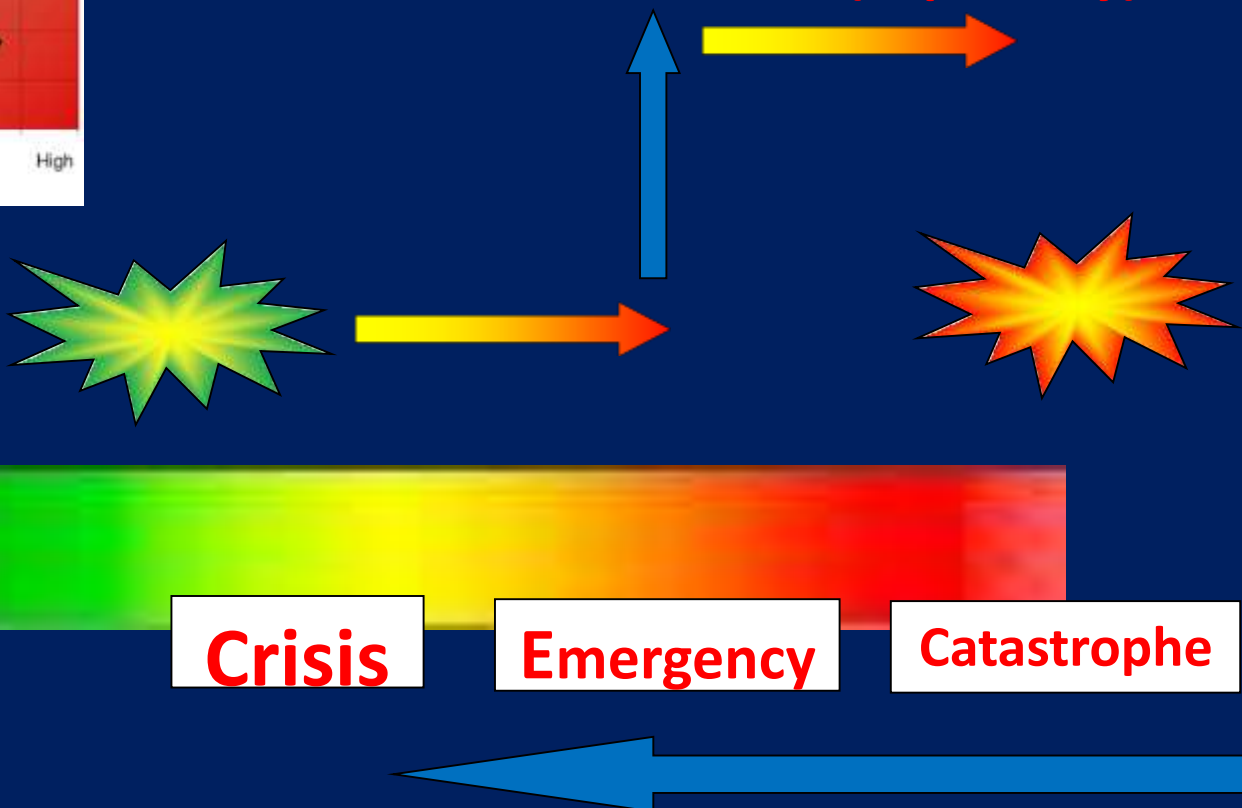

FINAL OVERVIEW

Emergency Threshold Index (ETi)

$$ETi = + \Delta \text{ Resources (capability)}$$

A NEW FORMULA FOR A NEW APPROACH

$$\text{EVENT} = F \cdot D = \text{HAZARD (H)}$$

$$\text{DAMAGE EXPECTED (DeX)} = H \cdot V \quad \longrightarrow \quad \text{RISK} = H \cdot V \cdot E$$

$$\text{EmC (Emergency Context)} = \text{Dex} / O$$

$$\text{Emergency Threshold Index (ETi)} = \frac{\text{DEX}}{\text{CDRI} \cdot O} \cdot E$$

F= frequency;

D = Danger;

H = Hazards

V= Vulnerability

E= Exposure;

O = Organization = Coordination · Communications · Resources

CDRi = Community Disaster Risk Index

WHY WE WANT MEASURE RESILIENCE

Index (qualitative and quantitative) for a development of mitigation actions. The target is to maintain low the severity by an extreme event impact.

Operating-conceptual tool for an harmonic and overall development of preparedness, planning and emergency management.

Evaluation tool for the territorial resilience to support the safeguard and environmental development policies.

Tool for activities evaluation of pre and post event, for a better use of available resources.
