### Letter of support

The Riga Municipal Agency "Riga Energy Agency" (REA) supports the project "Individual Heating Evaluation Platform (IHEP)" submitted by Riga Technical University. The aim of this project is to develop policy recommendations to a sustainable and low-emission individual heat supply in Latvia by 2030/50. The strategy aims to achieve sustainable and environmentally friendly decentralized heat supply by promoting economic, social and environmental benefits at municipal and national level. The platform offers the opportunity to evaluate the existing situation regarding individual heating and study the possible solutions for improvement of the sector.

Project has high socio-economic impact. Active work will be done to educate the population using different knowledge dissemination activities, including instruction for using the developed platform and seminars. Aim of dissemination activities is to demonstrate innovative possibilities for individual heat supply development and become more efficient and environmentally friendly. As a result, the heating bills of households can be reduced, while improving the level of well-being of the population.
